Device and process for forming solid reinforcing rib from rotational molding container at one step

The invention discloses a device for forming a solid reinforcing rib from a rotational molding container in one step. The device comprises a rotational molding mold, a crank arm and a heating box; the rotational molding mold is arranged on the top surface of a rotating disc, the rotating disc is connected with the crank arm, and the rotational molding mold is located in the heating box for heating forming; an upper die is arranged on the outer wall of a lower die in a sleeving mode and axially moves in the vertical direction of the lower die, an annular reinforcing rib structure is arranged at the joint of an inner cavity of the upper die and an inner cavity of the lower die.

Five unembellished furniture designs by Saltzman Prize-winner Marco Campardo

01/02/2023

London's Design Museum has crowned Marco Campardo the winner of its annual Ralph Saltzman Prize for emerging designers. Here, the Italian designer walks us through five of his key projects and explains why he is "not a very decorative guy". Campardo, who started his career as a graphic designer in Venice, set up his own studio in Peckham in 2019 with a focus on material experimentation and "hacking" industrial processes to create unexpected outcomes. Although it now includes a range of seating, tables and storage (pictured top), the Jello collection started out with a commission for a single stool from the Macro museum in Rome and the aim to produce 30 of these stools on a shoestring budget in only five days. Working within these constraints, Campardo adapted the established industrial process of rotational moulding using custom-made moulds made from laminated cardboard scraps, as traditional metal moulds can cost hundreds of thousands of pounds to develop.
